L.E. Torczon credits AutoCAD Product Key for being the design tool that made him a professional, creating architecture in CAD. He founded his own architectural firm in 1989, using AutoCAD to create two-dimensional plans and elevations and to edit his drawings. How to create professional-looking drawings in AutoCAD, Part 1: Drawing guides and snap-to In this first part of our series, we'll start by looking at how to draw guides and snap to in AutoCAD. Drawing guides A drawing guide is a line that you draw over an existing drawing that you want to copy (copy line). It is used for aligning your drawing to an existing drawing, or for a more precise placement of your drawing within the existing drawing. Use the appearance property to create guides: Select your drawing and display the Properties palette. Choose Appearance > Guides. Draw a guide. You can also access this palette via the Drawing > Guides > Show Guide dialog box, or by using the controls

on the Guide toolbar. To lock the guide, change the property to Locked. Use the Lock Property button to lock the guide. The lock button is a toggle icon. Click it once, to unlock the guide. Click the button again, to lock the guide. If you want the guide to appear again after you've unlocked it, leave the property to Unlocked. To delete the guide, display the Properties palette and choose Guides > Delete Guide. You can also access this palette via the drawing surface > guides > delete guide command. Use the Show Guides button to hide the guides or display them. The Show button is a toggle icon. Click it once, to hide the guides. To show the guides again, click the button again. Snap-to Use the Snap Mode button to switch between Snap mode and Fit mode. Snap mode, like Align mode (see below), uses only the coordinates of the selected point. Fit mode, like Measure mode (see below), uses the specified distance (a numeric value). To toggle between the two modes, click the Snap Mode button. AutoCAD also offers a number of built-in snap-to modes, such as all four sides of a box, corners, lines, midpoints, edges, nodes, intersections, and centroids. See the Snap

I have a question on the code below: int x=1; string y="Hello"; x = ++y; What is the meaning of the variables x and y? A: x is of type int. y is of type std::string. C++ has no implicit cast. It simply takes whatever type you give it, and discards it. So you don't need to cast it. In this case you're trying to assign the value of an rvalue to an lvalue. The assignment operator isn't going to work. This doesn't happen in C either. In C++, you can use static_cast(x) to cast x to type int (of course the result will be the same as x) /* * Copyright (C) 2012, 2016 Apple Inc. The sugar draws the moisture out of the meat, while the salt and spices concentrate the flavor. I found this rub while making my mom's cooking one summer night after I put it through the blender. It made for a moist and flavorful chicken and is great for ribs too. —Miriam Forman Advertisement Makes 2 2 tbsp. Paprika 1 tsp. Salt 2 tbsp. Brown sugar 1 tbsp. Chili powder 1 tbsp. Allspice 1 tsp. Markup Assist makes it easy to tag and edit text, images, shapes, lines, polylines, and points in your drawings. Any time you need to update a drawing that contains a graphic, or create a new shape or edit text, all you need is your keyboard and a new drawing. To apply the tag or edit information to your drawings, it is as simple as typing. Changes to the text, images, shapes, lines, polylines, and points appear automatically in the drawing where you applied the tag or edit information. Markup Import supports: RAPID: Import text, images, and colors from paper, PDFs, and images directly into your current drawing (video: 5:28 min.)
