Extracellular matrix mediates in vitro changes in human corneal endothelial cell sensitivity. To determine whether changes in matrix components that occur in culture influence the sensitivity of human corneal endothelial cells (HCEC) to toxic agents. University-based research laboratory. HCEC were isolated from corneas collected during eye bank procedures and cultured in alpha-modified Eagle medium (alpha-MEM) with bovine serum albumin (BSA) and fibronectin. To test the role of matrix in mediating responses, cells were plated on BSA alone or BSA plus laminin or fibronectin in 96-well plates. After 24 hours, when cells were attached and spreading, media were replaced with serum-free medium containing various concentrations of the toxic agent 5% glucose (heat-killed) or 10% hydroxyethyl methacrylate (HEMA) or HEMA with glutaraldehyde (GA) and the media were added. After 3 days, cell numbers and viability were determined by the clonogenic assay. Preincubation with the matrix components laminin or fibronectin alone significantly reduced the effectiveness of 5% glucose in causing HCEC to decrease in number or become nonviable. However, combined treatment with these components with 5% glucose did not decrease their effectiveness. Preincubation of HCEC with laminin and 5% glucose decreased cell sensitivity to 10% HEMA, with or without GA. In contrast, HEMA alone reduced cell number and decreased viability even in the presence of laminin. The effects of HEMA and GA were additive. However, combining HEMA with fibronectin reduced the effects of HEMA alone. Changes in matrix components alter the sensitivity of HCEC to toxic agents. The mechanism of the protective effect of fibronectin is not known. Bring multi-format files to drawings. Preview and change the graphic format and resolution of files automatically. (video: 2:15 min.) Freeze images on planes and axes. Add all lines and other objects to the frozen image and then move it around. (video: 1:50 min.) Add stop-motion animations and illustrations to drawings. Draw a line and animate the line along a path using the TINY move. Draw a polyline and animate the polyline from one point to another. (video: 3:13 min.) Use the color picker to see what colors are in your image. Select from a palette of colors from your image, from the image you copied, or from a color key. (video: 1:38 min.) Warp images to fit a selected region. Create new drawing or existing drawing and apply a warp operation to the image. (video: 2:01 min.) Draw a freehand shape or a vector shape to a coordinate in the drawing. Convert the drawing into an editable shape layer or shape symbol. (video: 2:55 min.) Use custom-ink paper and calligraphic ink. Save ink strokes from the Paper and Graphic Tools as a drawing layer. Paint over the layer or export the drawing to a new drawing file. (video: 2:18 min.) Import web documents directly into a drawing. Add web pages to your drawings, using the SVG import, JPEG import, or Zim Import extensions. (video: 1:19 min.) Use GPS coordinates in drawings. Add the GPS coordinate to your drawing, as a line, polyline, arc, or arc segment. (video: 2:05 min.) Create your own colored geometry. Add a new pattern to your drawings and edit the pattern as an image-based drawing. (video: 1:31 min.) Use the Paint Tool to fill a region. A selected color fills a region in a drawing.
